

CONFUSED ABOUT DECENTRALIZED CLINICAL TRIALS? WE CAN HELP!

Worldwide Clinical Trials provides consultative support to help design your protocol to incorporate any and/or all elements of Decentralized Clinical Trials (DCT), factoring in cost, quality, timelines, safety, and logistics. By taking this approach, we drive a patient-centric solution that speeds up recruitment and enhances retention for your study participants, and reduces the burden on sites.

Not sure where to start? Consider these important questions when implementing DCT solutions:

Is **visit frequency** a potential burden on the patients?

What is the patient's **work schedule**?

Is there intense **competition** for this patient population?

Are potential patients **geographically dispersed** and possibly far from a site?

Is it important to improve the **patient experience** in your trials?

Can your **endpoint be measured** remotely or via ePRO?

Is the **investigational product (IP)** an oral formulation or easily self-administered?

Is the **sponsor** open to incorporating DCT components and the **cost implications**?

Would these **patients be open** to someone coming to their home?

Is the patient population (or caregiver) able to operate basic **technology** and have **internet access**?

Would **investigators** be open to applying decentralized methods in this specific protocol?
