

A Committed Partner for Parkinson's Disease and Other Movement Disorder Trials

Worldwide Clinical Trials has an extensive history of supporting sponsors dedicated to advancing treatments for Parkinson's disease (PD) and other movement disorders, including multiple system atrophy (MSA), progressive supranuclear palsy (PSP), Huntington's disease (HD), muscular dystrophy (MD), and tardive dyskinesia (TD). Our scientific teams have cultivated a broad, contemporary knowledge of PD and offer accessible expertise that spans all phases of development.

We take a consultative approach with our sponsors, personalizing each partnership based on their unique needs and retaining the flexibility to adapt throughout the development of the program. Using our operational acumen, we drive forward efficient, high-quality trials that progress disease-modifying therapies and symptomatic treatments alike. Our teams are experienced in the delivery of PD trials with various therapeutic targets, strategies, and IMP types specific to PD studies and can help you secure the right sites for your next study.

Worldwide's Keys to Successful Study Conduct

1

Targeted recruitment and retention strategies, e.g., in the recruitment of specific patient population cohorts, such as early PD, iPD, familial PD, and other movement disorder studies

2

Partnerships with vendors that offer PD and other movement disorder-specific services, such as fluid biomarkers, digital biomarkers, and neuroimaging

3

Protocol optimization for science and participant experience

4

Strong site relationships
